

# Lecture Notes for **Machine Learning in Python**

## Professor Eric Larson **Dimensionality Reduction and Images**

# Class Logistics and Agenda

- **Logistics:**

- Lab grading...
- Next Time: Flipped Module
- Turn in one per team (HTML), please include team member names from canvas

- **Agenda**

- Common Feature Extraction Methods for Images
- Begin Town Hall, if time

# Class Overview, by topic

Table Data  
Visualization

Numpy, Pandas, Seaborn  
Overviews with some in-depth discussion

Dimension  
Reduction and  
Image Processing

Scikit-learn, Scikit Image,  
Intuition only, Some mathematics

Linear and  
Logistic  
Regression

Numpy, Recreate API for Scikit-learn  
Detailed mathematics for simple optimization  
intuition for advanced optimization

Neural Networks  
and Back Prop.

Numpy  
Detailed mathematics for NN operations

Wide and Deep  
Networks

Convolutional  
Networks

Recurrent  
Networks

Keras, Tensorflow  
Intuition, Detailed implement.

Ethics in  
Language Models

ConceptNet  
Case studies

# Last time...

$E1$	$E2$
0.85	0.85
0.52	-0.52

37.1	-6.7
-6.7	43.9

	$A1$	$A2$
1	66	33.6
2	54	26.6
3	69	23.3
4	73	28.1
5	61	43.1
6	62	25.6

	$A1$	$A2$
1	1.83	3.55
2	-10.1	-3.45
3	4.83	-6.75
4	8.83	-1.95
5	-3.17	13.05
6	-2.17	-4.45

zero mean

$$r_q = \frac{\sum_{j=1}^q \lambda_j}{\sum_{j=1}^p \lambda_j}$$

- an image can be represented in many ways
- most common format is a matrix of pixels
  - each "pixel" is BGR(A)
- used for capture and display

- sensor
- sensor
- sensor

# Review: Image Representation, Features

**Problem:** need to represent image as table data

- need a compact representation

1	4	2	5	6	9
1	4	2	5	5	9
1	4	2	8	8	7
3	4	3	9	9	8
1	0	2	7	7	9
1	4	3	9	8	6
2	4	2	8	7	9

# Review: Image Representation, Features

**Problem:** need to represent image as table data

- need a compact representation

**Solution:** row concatenation (also, vectorizing)

Row 1	1	4	2	5	6	9	1	4	2	5	5	9	1	4	2	8	8	7	3
Row 2	1	4	2	8	8	7	3	4	3	9	9	8	1	4	2	5	5	9	1
...																			
Row N	9	4	6	8	8	7	4	1	3	9	2	1	1	5	2	1	5	9	1

## Continued Demo

Images Representation  
in PCA and  
Randomized PCA

# Features of Images

# Extracting Features: Convolution

- For images:
  - kernel (matrix of values)
  - slide kernel across image, pixel by pixel
  - multiply and accumulate

## **This Example:**

3x3 Kernel (dark)

Ignoring edges of input

Input Image is 5x5

Output is then 3x3

# Convolution

$$\sum \left( \mathbf{I} \left[ i \pm \frac{r}{2}, j \pm \frac{c}{2} \right] \odot \mathbf{k} \right) = \mathbf{O}[i, j] \quad \text{output image at pixel } i, j$$

input image at  $r \times c$  range of pixels centered in  $i, j$

kernel of size,  $r \times c$   
usually  $r=c$

0	0	0	0	0	0	0	0	0
0	1	2	3	4	12	9	8	0
0	5	2	3	4	12	9	8	0
0	5	2	1	4	10	9	8	0
0	7	2	1	4	12	7	8	0
0	7	2	1	4	14	9	8	0
0	5	2	3	4	12	7	8	0
0	5	2	1	4	12	9	8	0
0	0	0	0	0	0	0	0	0

input image,  $\mathbf{I}$

0	0	0
2	3	4
2	3	4

1	2	1
2	4	2
1	2	1

kernel  
filter,  $\mathbf{k}$   
3x3

?

# Common operations

- the gradient (2D derivative)

# DAISY: same features, regardless of orientation

1. Select  $u, v$  pixel location in image
2. Take histogram of average gradient magnitudes in circle for each orientation  $\tilde{h}_{\Sigma}(u, v)$
3. Select circles in a ring,  $R$
4. For each circle on the ring, take another histogram  $\tilde{h}_{\Sigma}(\mathbf{I}_O(u, v, R_1))$
5. Repeat for more rings
6. Save all histograms as “descriptors”  
 $[\tilde{h}_{\Sigma}(\cdot), \tilde{h}_{\Sigma}(\cdot), \tilde{h}_{\Sigma}(\cdot) \dots]$
7. Can concatenate descriptors as “feature” vector at that pixel location

# Summary DAISY

Concatenate Histograms

$$\mathcal{D}(u_0, v_0) =$$

$$\left[ \begin{array}{l} \tilde{\mathbf{h}}_{\Sigma_1}^T(u_0, v_0), \\ \tilde{\mathbf{h}}_{\Sigma_1}^T(\mathbf{l}_1(u_0, v_0, R_1)), \dots, \tilde{\mathbf{h}}_{\Sigma_1}^T(\mathbf{l}_T(u_0, v_0, R_1)), \\ \tilde{\mathbf{h}}_{\Sigma_2}^T(\mathbf{l}_1(u_0, v_0, R_2)), \dots, \tilde{\mathbf{h}}_{\Sigma_2}^T(\mathbf{l}_T(u_0, v_0, R_2)), \end{array} \right]$$

take **normalized** histogram of magnitudes

$$\tilde{\mathbf{h}}_{\Sigma}(u, v) = \left\| \left[ \mathbf{G}_1^{\Sigma}(u, v), \dots, \mathbf{G}_H^{\Sigma}(u, v) \right]^T \right\|$$

**Tola et al.** "Daisy: An efficient dense descriptor applied to wide-baseline stereo." Pattern Analysis and Machine Intelligence, IEEE

# Free Parameters in DAISY

Num circles/per ring

Num rings

Num orientations within each circle

*Num of bins in histogram*

```
daisy(img, step=180, radius=58, rings=2, histograms=6,  
      orientations=8, visualize=True)
```

**Params**

step, radius, num rings, num histograms per ring,  
orientations, *bins per histogram*

Gradients

DAISY

(if time) Gabor Filter Banks

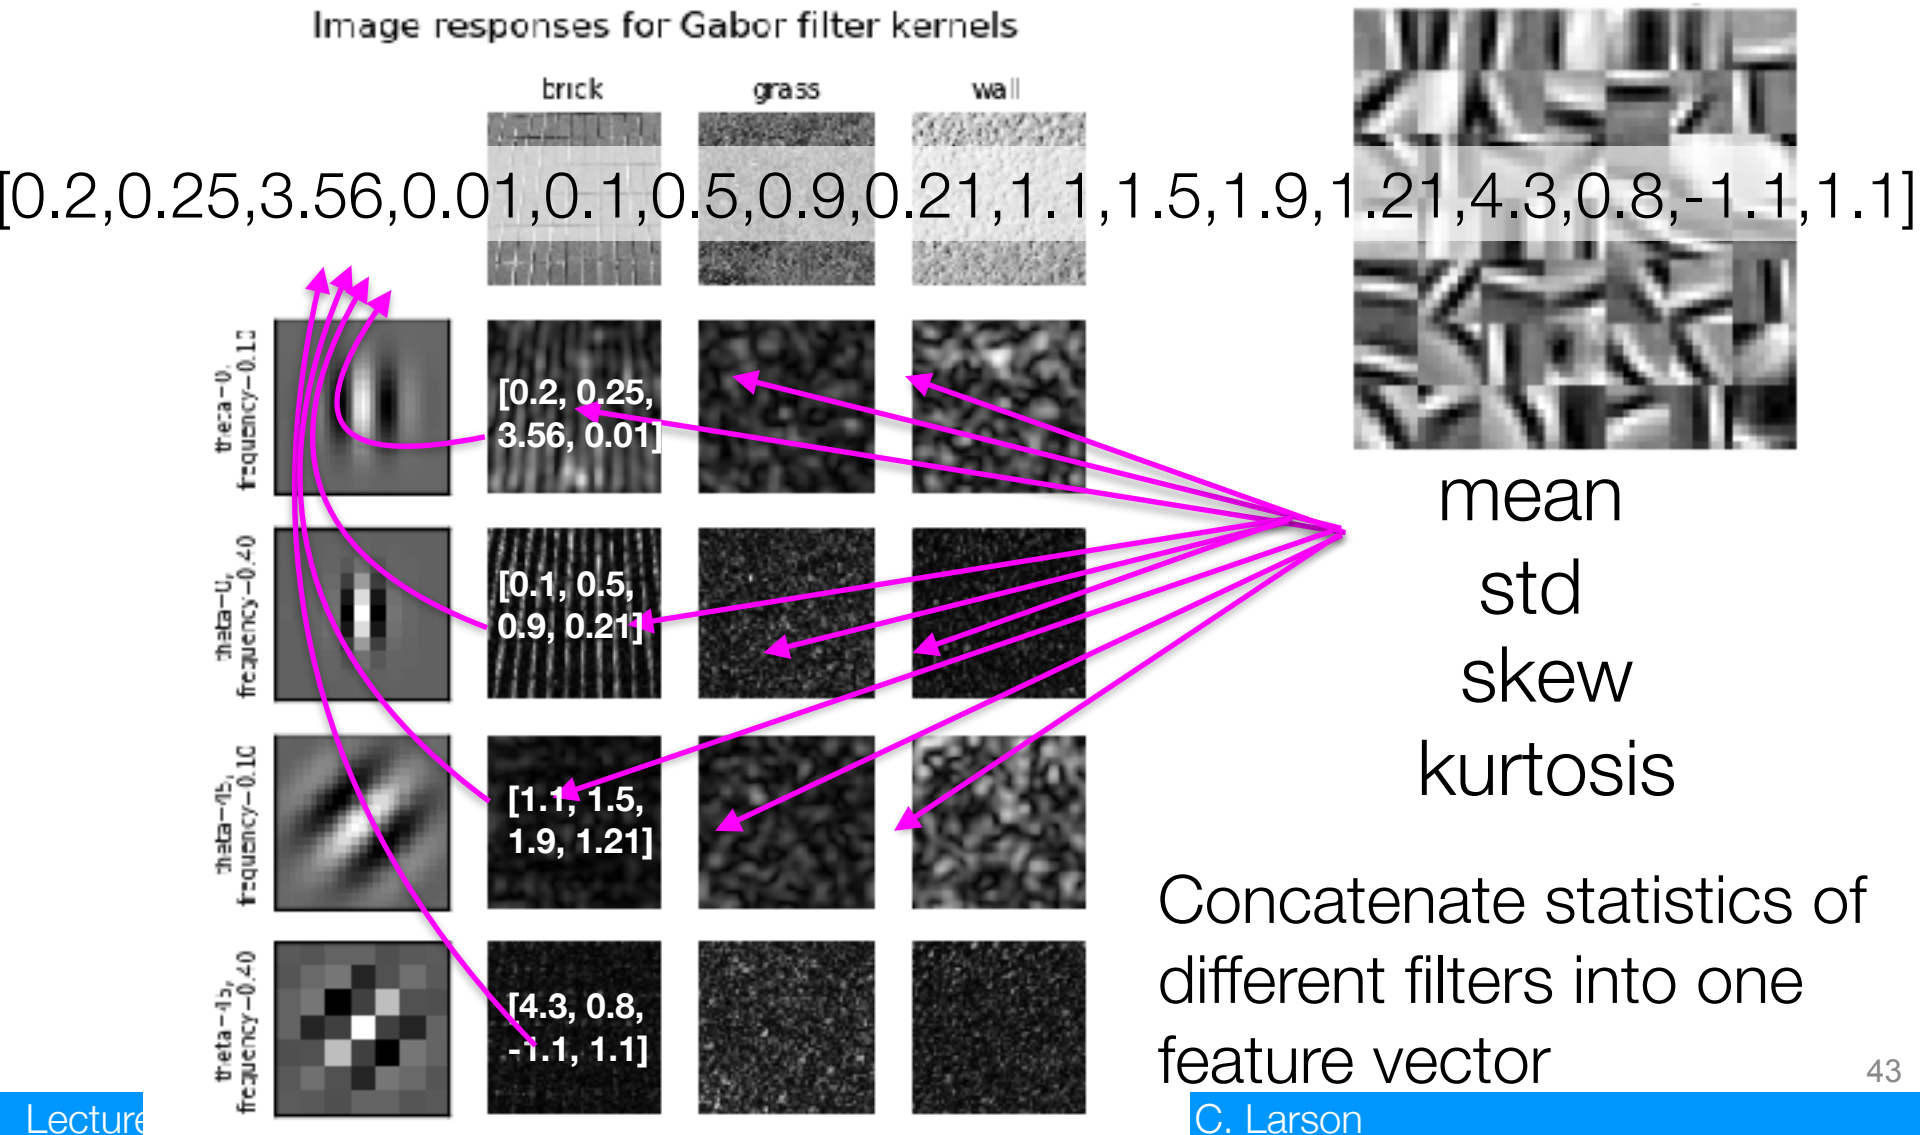

## Other Tutorials:

[http://scikit-image.org/docs/dev/auto\\_examples/](http://scikit-image.org/docs/dev/auto_examples/)

# Common operations: Gabor filter Banks (if time)

- common used for texture classification

# Matching versus Bag of Features

- Not a difference of vectors, but a percentage of matching points

- SURF, ORB, SIFT, DAISY

# Feature Matching

## Matching test image to source dataset

1. Choose src image from dataset
2. Take keypoints of src image
3. Take keypoints of test image
4. For each kp in src:
  1. Match with closest kp in test
  2. *How to define match?*
5. Count number of matches between images
6. Determine if src and test are similar based on number of matches
7. Repeat for new src image in dataset
8. Once all images measured, choose best match as the target for the test image

## Scikit-image Implementation

### match\_descriptors

```
skimage.feature.match_descriptors(descriptors1, descriptors2, metric=None, p=2,  
max_distance=inf, cross_check=True, max_ratio=1.0)
```

[\[source\]](#)

Brute-force matching of descriptors.

For each descriptor in the first set this matcher finds the closest descriptor in the second set (and vice-versa in the case of enabled cross-checking).

# Town Hall for Lab 2, Images

- **Quiz is live:** Image Processing!
- **Next Time:** Logistic Regression

# Supplemental Slides

Peruse these at your own leisure!

These slides might assist you as additional visual aides

**Slides courtesy of Tan, Steinbach, Kumar**  
**Introduction to Data Mining**

# Dimensionality Reduction: LDA

- PCA tell us variance explained by the data in different directions, but it ignores class labels
- Is there a way to find “components” that will help with **discriminate** between the classes?

$$\arg \max_{comp.} \frac{\sum \text{differences between classes}}{\sum \text{variance within classes}}$$

- ❑ called Fisher’s discriminant
- ❑ ...but we need to solve this using using *Lagrange multipliers* and gradient-based optimization
- ❑ which we haven’t covered yet

I invented Lagrange multipliers... and ...*nothing* impresses me...

# Dimensionality Reduction: LDA versus QDA

$$\arg \max_{comp.} \frac{\sum \text{differences between classes}}{\sum \text{variance within classes}}$$

# Dimensionality Reduction: LDA versus QDA

$$\arg \max_{comp.} \frac{\sum \text{differences between classes}}{\sum \text{variance within classes}}$$

- “*differences between classes*” is calculated by trying to separate the **mean value** of each **feature** in each **class**
- Linear discriminant analysis:
  - assume the covariance in each class is the same
- Quadrature discriminant analysis:
  - estimate the covariance for each class

# Self Test ML2b.2

LDA only allows as many components as there are unique classes in a dataset.

- A. True
- B. False

❑ Need more help with the PCA algorithm (and python)?
